

Petio

Petio is a mobile application project created for current and prospective pet owners in Cambodia. It brings community support, local pet services, products listing and lost-and-found information together in one friendly place. It also gives local small pet businesses a place to present their services and products.

A comprehensive project submitted in partial satisfaction of the requirements for the degree of Bachelor of Science (Hons) in Software Engineering with Multimedia

PETIO: A COMMUNITY AND PET CARE PLATFORM

Petio is a mobile application prototype designed to support current and prospective pet owners in Cambodia. It brings together Community Forum and Chat, Service Directory, Marketplace and Lost and Found. The design also includes Adopt and Foster as well as Pet Readiness as supporting modules. Petio gives local pet businesses a clear way to present their services and products while allowing users to contact them directly.

ABSTRACT

Petio is a mobile-application UX/UI prototype designed to bring pet-related information, local services, product listings, community support, as well as lost-and-found reporting into one clear and friendly interface for the benefit of current and prospective pet owners in Cambodia. The project was informed by a pet-owner survey and an observation of 10 local pet-business Facebook pages. The research identified difficulties in finding suitable services, navigating pet healthcare, and gathering clear information from different sources. The observed business pages also differed in how they presented prices, services, contact methods, and information that customers may use to judge trust. These findings apply only to the participants and pages reviewed. No business interviews or usability testing were conducted. Petio was designed around four core features: Community Forum and Chat, Service Directory, Marketplace, and Lost and Found. Adopt and Foster and Pet Readiness are included as supporting modules. The Marketplace supports product listings and direct seller contact without ordering, checkout, payment, or delivery functions. The completed deliverable is an interactive Figma prototype with connected user flows and simulated interface behaviour. It is not a developed or deployed application and does not include working backend services. The users, businesses, ratings, badges, and listings shown in the prototype are sample content used to demonstrate the design. Overall, Petio presents a structured mobile interface that explores how common pet-related needs can be supported within one application.

DEDICATION

This work is dedicated to my supportive parents, mom, and dad. Thank you for believing in me even on the nights I doubted myself, every sacrifice you made, your time, patience or money just to support me on my journey, just to give me the space to accomplish this, it means more than I can put into words. This work is as much yours as it is mine.

To my lecturers and mentors, Ms. Ratha NIT and Mr. Wathana. Thank you for your patience in guiding me and my team, even with how busy your schedules were. I especially want to thank Ms. Ratha for helping me decide on my concept note, guiding me toward the idea that would become Petio and making sure I had the best possible foundation to build on. Your dedication to helping me accomplish this did not go unnoticed, and I am truly grateful for the time you gave me despite everything else demanding your attention.

To my teammate, Keo Ratanak, thank you for your dedication in getting this done. I appreciate how you collaborated in this project, staying committed to the tasks in front of you, and pushing this project forward with me every step of the way.

To my friends and classmates especially, Bot, Taro, and Kunwath, thank you for supporting me along the way, both with the work itself and in keeping me mentally grounded when things got heavy. Your presence made this journey much better.

To my girlfriend, thank you dear for going through this with me, even when it was hard. You kept me focused when I could have easily lost my way, and you supported my mental health through all of it, even while carrying so much responsibility of your own. I see how much you gave to be there for me, and I don't take it for granted my love.

Finally, to myself, thank you for not giving up, even on the nights this felt like too much. This project tested my patience, my skills, and my ability to keep going when I doubted whether I could pull it off. I'm proud of the person who built this, not just the thing that got built.

**Mr. David
Lao
26/August/2026**

I would like to dedicate this project to my parents and my family, who always supported me and gave me a lot of advice through this journey. Thank you for your love and encouragement even though sometimes mom and dad are busy with their work and still motivate me to continue working hard and face every challenge during this project.

To my lecturers and mentors, Ms. Ratha NIT and Mr. Wathana. Thank you for your guidance and knowledge, especially for your valuable feedback. I would like to express my sincere appreciation to my lecture Ms. Ratha for your support and help me improve ideas and feedback on my skills to complete this Project Petio successfully.

To my teammate, Lao David, thank you for believing me for every work I have done and cheer me up whenever i felt down and lost focus. I'm glad how you shared the idea with each other, especially when we faced difficulties during the development of Petio.

To my classmates and friends, thank you for your idea even though we aren't in the same team and still give a lot of advice and good feedback throughout this project. Their support helped me stay focused and motivated to build this project successfully.

Finally, I would like to dedicate this work to myself for the effort, patience, and not giving up on the hard times. Working on Petio project has improved me with my problem solving and communication skills with my teammates. I'm super proud of the progress I have made so far.

**Mr. Ratanak
Keo

Chapter 1: Introduction

1.1 Project Background

Pet ownership is not only about giving pet a home or feeding it, but also a much bigger responsibility. Pet owners must understand healthcare, vaccinations, daily care, suitable products, and how to arrange a proper place for their pet if they're unavailable or need to go somewhere. More importantly for someone preparing for their first pet, it may also be difficult to judge the time, cost, and long-term commitment involved. Therefore, clear and practical guidance is important before and throughout pet ownership.

We did a survey that got 41 responses with 40 people answering most of the questions. Overall, people around 45% already owned a pet and 38% were planning to get one. This gave us the opinions of people who already take care of pets well as those who are getting ready to own a pet.

Cambodia also has an online audience. By the end of 2025 Cambodia had 12 million users on the internet and around 14 million social media user's identities (DataReportal, 2026). These numbers show that online services and social platforms are already the perfect ways to get and share information. However, they don't prove that every pet owner in Cambodia would use Petio.

Based on this context, Petio was explored as a mobile-application prototype for current and prospective pet owners in Cambodia. The project examines how pet-related information, community support, local services, product listings also lost-and-found reporting can be presented through one mobile interface. The specific difficulties identified through the research are discussed in the following section.

1.2 Current Problems

A. Scattered Pet-Care Information

Pet-care information is spread across several sources. In the survey, 23 respondents selected Facebook, 17 selected friends and family, and 13 selected Google as places they look for pet-related information. Users may need to move between posts, recommendations, search results, and individual business pages to find and compare what they need.

B. Difficulty Finding Suitable Pet Services

Finding reliable pet services was another issue for the survey participants. Twenty-eight out of 40 people or 70% said they had trouble finding trusted services like grooming, pet hotels or pet sitters. In another question 27 people or 68% said they needed someone to look after their pet when they were away. These results show that there is a need for service information and an easier way to compare options, especially when arranging care for a pet when the owner is not around.

C. Difficulty Verifying Service Providers and Sellers

Choosing a service provider or seller can be difficult when users have little information about their reliability. In the survey, around 63% of respondents said they would feel safer using verified sellers and service providers. This result highlights the need for a clearer way to judge reliability before arranging a service or making a purchase.

D. Difficulty Navigating Pet Healthcare

Pet healthcare was the most frequently selected challenge in the survey, chosen by 25 of the 37 respondents who answered that question, or around 68%. Healthcare decisions can involve vaccinations, routine check-ups, and knowing when professional treatment is needed. Without a clear starting point, owners may be unsure about the next step, or which veterinary service fits their situation.

E. Limited Preparation for Pet Ownership

Fifteen out of the forty people who answered the question about owning a pet, about 38 percent were planning to get a pet. This made people who are thinking about getting a pet a group for the project. The survey did not ask directly if these people were ready for ownership. One person wrote in the open-text section and suggested a Pet Readiness check that looks at time, money, lifestyle and being committed. This shows that it makes sense to include preparation, as something to think about when designing something. It does not mean that all people who want a pet are not ready. Clear guidance can help people think about how time they have where they live, how much money they expect to spend and whether they can take care of a pet for a long time before they bring a pet into their home.

1.3 Goal and Objectives

The goal of this project is to design Petio, a mobile application prototype for current and prospective pet owners in Cambodia. The design brings pet-related information, local services, product listings, community support, and lost-and-found reporting into one interface. It also gives local pet businesses a structured space to present their services and products to people looking for pet-related support.

The completed project output is an interactive Figma prototype that demonstrates Petio's main and supporting user journeys through connected screens and simulated interactions. It is not a developed or deployed application and does not include working backend services. The following four objectives guided the design of the prototype.

1.3.1 Quality Enhancement

Petio aims to improve the clarity and organization of pet-related information. In the prototype, Community Forum and Chat organises discussions into categories and post threads, while the Service Directory presents business information in a consistent format. These design choices are intended to make information easier to find and review. They do not mean that community advice or displayed business details have been medically or independently verified.

1.3.2 Inclusivity and Accessibility

Petio is designed for experienced pet owners, first-time owners, and people who are still deciding whether pet ownership fits their situation. The mobile interface uses clear navigation, plain language, consistent screen layouts, and guided forms to help users follow the main journeys. Categories, search tools, and filters also help users find information based on their needs. However, usability and accessibility testing has not yet been conducted.

1.3.3 Economics and Empowerment

Petio aims to give local pet businesses and sellers clearer visibility within a pet-focused mobile interface. The Service Directory presents structured information such as services, location, opening information, ratings, and contact options. The Marketplace allows sellers to display product listings with details such as price, condition, availability, location, and contact information. These prototype flows support business discovery and direct enquiries without including ordering, checkout, payment, or delivery functions.

1.3.4 Technological Efficiency

Petio uses a consistent mobile interface to connect its main and supporting user journeys. Reusable components, shared navigation, and linked screens help users move between different areas of the prototype clearly. Figma Prototype mode simulates interactions such as opening menus, completing forms, and viewing confirmation states. These connected interactions demonstrate the intended behaviour of the application, but they do not represent a working database, backend, or production system.

1.4 Methodology & Project Plan

This project used a descriptive and exploratory approach to understand the needs of current and prospective pet owners and local pet businesses in Cambodia. Primary research consisted of a pet-owner survey and structured observation of 10 public local pet-business Facebook pages.

Secondary research provided wider context about Cambodia's digital environment and comparable online platforms. Together, these methods provided evidence for Petio's interface design, feature decisions, and project planning.

The observation findings describe only the 10 selected Facebook pages and should not be treated as representing every pet business in Cambodia. No business interviews or usability testing were conducted.

Data Collection

Primary Data:

- **Survey:** A structured questionnaire was shared with current and prospective pet owners through Facebook groups and personal networks. It received 41 submissions, although the number of responses varied between questions. The survey examined pet ownership, common pet-care challenges, information-seeking behaviour, difficulty finding services, and interest in a platform such as Petio. The findings supported the problem definition in Chapter 1 and the development of user typologies and personas in Chapter 2.
- **Business Page Observation:** A structured observation was conducted across 10 public Facebook pages belonging to veterinary clinics, groomers, pet shops, and other local pet-related businesses. Each page was examined using consistent criteria, including business type, service and product information, pricing visibility, posting activity, response behaviour, trust signals, and contact methods. The findings were recorded in an observation matrix and used to identify patterns that informed the business typology, business persona, Service Directory, Marketplace, and design criteria. Since no interviews were conducted, the observation does not provide direct business opinions, motivations, or quotations.

Secondary Data:

- **Digital and Population Reports:** Information from (DataReportal, 2026) was used to understand Cambodia's population, internet access, and social media use. This provided wider context about the country's digital environment.
- **Existing Platforms Review:** Rover was reviewed as a reference for pet-service discovery, Petfinder for pet listings and search, and Khmer24 for local marketplace patterns. This comparison helped identify useful approaches and gaps relevant to Petio's prototype features and interface design.

1.4.1 Methodology Methods and Tools

Petio is designed as a mobile-application prototype for current and prospective pet owners in Cambodia. The interface focuses on clear navigation, consistent layouts, and connected user journeys across its main and supporting features. The completed project presents this design through an interactive Figma prototype rather than a coded or deployed mobile application.

A. Proposed Technology for Future Development

Petio has not yet been developed as a working application. However, the approved concept note proposes a possible technology stack for future development. Flutter would support the mobile interface, while Laravel and MySQL would manage the backend API and stored data. Additional

services could support authentication, messaging, location features, image storage, and notifications. These technologies were not implemented or tested during the current project.

Category	Proposed Technology or Tools
Mobile Frontend	Flutter, Dart
Backend API	Laravel 12 (PHP)
Database	MySQL
Authentication	Laravel Sanctum
Real-Time Features	Laravel Reverb
Location Services	Google Maps API
Image Storage	Cloudinary
Notification	Firebase Cloud Messaging
UX/UI Design and Prototyping	Figma

The proposed technologies show how Petio could be built in the future. They do not mean that the current prototype already has a working backend, database, authentication, live messaging, maps, image storage or notifications.

B. Project and Development Methods

The completed design phase of Petio followed a research-informed, user-centred, and iterative process. Research findings were used to define user needs, organise content, and guide the interactive Figma prototype. The future development methods described below are proposed directions and were not implemented during the current project.

- **User-Centered Design:** Design decisions were guided by the pet-owner survey, observation of local pet-business Facebook pages, and the review of existing platforms. This helped connect the proposed features to the needs identified through the research.
- **Iterative Prototyping:** Petio's interface progressed from early layouts and wireframes to detailed screens, reusable components, and connected user flows. Revisions were made throughout the design process to improve clarity and consistency. Formal usability testing has not yet been conducted.

- **Mobile-First Design:** The interface was designed for mobile devices using clear navigation, consistent screen layouts, readable content, and reusable components. The final prototype demonstrates the intended mobile experience through connected Figma interactions.
- **API-Based Architecture:** If Petio is developed in the future, the Flutter mobile application would communicate with a Laravel backend API. This would separate the mobile interface, application logic, and stored data.
- **Database-Driven Structure:** MySQL is proposed for storing information such as user accounts, business profiles, product listings, community posts, messages, and lost-and-found reports. This database functionality does not exist in the current prototype.
- **Cross-Platform Development:** Flutter is proposed for future development because it can support Android and iOS applications from a shared Dart codebase. This would allow the future mobile application to provide a consistent experience across both platforms.

1.4.2 Project Planning Timeline

Step	Task	Start	End	Duration	Deliverables	Dependency
1	Concept note	25 Jun	28 Jun	4 Days	N/A	Project Kickoff
2	Research	28 Jun	5 Jul	8 Days	Document	Concept Note
3	Comparing Data	5 Jul	9 Jul	5 Days	Document	Research

Project Planning – Petio

Figure 1.1 Project Planning

Phase 1: Concept and Research (25 June - 9 July)

This phase began with finalising the concept note, followed by primary and secondary research into pet ownership, local services, and Cambodia's digital environment. The collected information was then analysed to determine whether the proposed concept responded to identified user needs before the project moved into design.

Phase 2: Design Foundations and Business Observation (9 July - 28 July)

This phase focused on developing Petio's visual direction through a mood board and brand identity. During this period, 10 public local pet-business Facebook pages were reviewed using Petio Field Notes. The observation provided evidence about service and product information, pricing visibility, posting activity, response behaviour, trust signals, and contact methods. These findings helped guide Petio's mobile interface design.

Phase 3: Design Refinement and Prototyping (28 July- 23 August)

Research findings were used to refine the concept, mood board, and brand direction before the detailed interface work began. The main activity during this phase was designing Petio's wireframes and interface screens in Figma. The screens covered the four core features: Community Forum and Chat, Service Directory, Marketplace, and Lost and Found.

Phase 4: Final Production and Testing (22 August - 25 September)

This phase included producing the poster, flyer, and brochure while completing the interactive Figma prototype. The prototype was tested internally to check its buttons, navigation, menus, forms, overlays, confirmation states, and connected user flows. Any interaction issues found during this review were corrected. This was functional prototype testing rather than usability testing with external participants. The remaining time was used to complete the document and visual materials for final review and submission.

Chapter 2: RESEARCH AND OPPORTUNITY

This chapter explains how research was used to understand Petio's intended users and guide its mobile-interface design. It presents the primary research findings, followed by the user typologies, personas, journey maps, and design criteria developed for the interactive Figma prototype.

2.1 Primary Research

Petio's primary research examined the needs of current and prospective pet owners and how local pet businesses present information online. Two methods were used: a pet-owner survey and a structured observation of 10 public pet-business Facebook pages. No interviews with business owners were conducted.

Current Pet-Care Journey

The research suggests that people usually move between several information sources when looking for pet-related support. Their journey can be generalised as follows:

- **Recognize a Need:** A person needs pet-care information, a veterinary service, grooming, temporary pet care, or a suitable product.
- **Search Across Different Sources:** They search Facebook pages and groups, ask friends or family, use search engines, or contact a veterinarian.
- **Review Available Information:** They compare posts, comments, recommendations, and information displayed on individual business pages.
- **Contact Providers or Sellers:** They contact possible providers or sellers to ask about prices, availability, location, services, or products when this information is not publicly displayed.
- **Assess Trust:** They consider recommendations, reviews, posting activity, customer comments, and visible business information when deciding whether an option appears reliable.
- **Choose or Continue Searching:** If an option meets their needs, they choose it. Otherwise, they return to an earlier step and continue searching.

Pet-Owner Survey Findings

The survey received 41 submissions, although the number of answers varied between questions, with most questions receiving 40 responses. The main findings were:

- **Ownership Stages:** Among the 40 respondents who answered the ownership question, 18 currently owned a pet, 15 were planning to get one, and seven did not

currently own or plan to get one. This provided perspectives from people at different stages of pet ownership.

- **Information Sources:** Facebook was selected by 23 respondents, friends and family by 17, Google by 13, and veterinarians and YouTube by 10 each. This indicates that respondents use several sources when looking for pet-related guidance.
- **Common Challenges:** Pet healthcare was the most frequently selected challenge, chosen by 25 of the 37 people who answered the question. Finding pet services received 16 selections, while finding someone to care for a pet received 13.
- **Service Difficulties:** Twenty-eight of 40 respondents had struggled to find trusted pet services, while 27 had needed someone to care for their pet while they were away.
- **Trust:** Twenty-five of 40 respondents said they would feel safer using verified sellers and service providers. This indicates a preference for clear provider details and visible trust information, rather than confirming the need for a formal verification system.
- **Feature Interest:** Pet Services received the highest interest with 25 selections, followed by Community & Chat with 20, Lost & Found Pets with 14, and Pet Marketplace with 10. Pet-care articles received 16 selections and can be included as supporting educational content rather than as a separate core feature.

Business-Page Observation Findings

A structured observation was conducted across 10 selected public pet-business Facebook pages. The review covered pricing visibility, posting activity, response behaviour, contact methods, trust signals, and service or product information.

- **Pricing Visibility:** Eight pages displayed no prices, one displayed price for some items or services, and one displayed price for most items or services.
- **Posting Activity:** Four pages posted daily or nearly every day, two posted about once a week, and four posted less than once a week.
- **Response Behaviour:** Four pages usually replied within one day, four replied after one day, and two showed mixed or inconsistent response times.
- **Contact Methods:** All 10 pages provided Messenger, phone and Telegram contact options.
- **Trust Signals:** The pages used different trust indicators, including addresses, maps, opening hours, customer reviews, customer photographs, staff credentials, and before-and-after examples.

- **Information Consistency:** Service and product information differed between pages. Details such as prices, availability, location, and service descriptions were not always clearly displayed.

Design Implications

The findings support presenting business and listing information in a more structured format. Petio's Service Directory therefore includes service categories, business details, location, opening information, and contact options. Marketplace listings include category, price or "contact for price," condition, availability, location, description, and seller contact details.

Both features allow users to contact providers or sellers directly. They do not include ordering, checkout, online payment, or delivery functions.

Research Limitations

The survey used a small convenience sample recruited through online and personal networks, and respondent location was not collected as a survey question. The business observation covered only 10 selected Facebook pages and recorded information that was publicly visible at the time of review. Displayed contact details and trust signals were not independently verified. Therefore, the findings guide Petio's design but do not represent every pet owner or pet business in Phnom Penh or Cambodia.

2.2 User Typology

Based on the primary research findings, Petio's users can be divided into three main groups. These groups are defined by their relationship with pet ownership and their role within the platform. Each group has different problems and requirements that influence Petio's interface and features.

A. Prospective Pet Owners

This group includes people who are planning to get a pet or are still learning about the responsibilities of pet ownership. They may use social media, recommendations, search engines, and individual business pages to find information before making decisions.

Problems:

- Pet-care information is spread across different sources and may be inconsistent.
- It can be difficult to understand everyday care, healthcare needs, responsibilities, and expected costs.

- They may not know which services, products, or information sources are suitable for new pet owners.

Requirements:

- Beginner-friendly pet-care information and community discussions.
- Clear access to service categories, business details, locations, and contact options.
- A simple way to browse relevant products and services before becoming a pet owner.
- Guidance that supports informed and responsible pet-ownership decisions.

B. Current Pet Owners

This group includes people who currently own pets and needs support with everyday care, healthcare, temporary pet care, products, and unexpected situations. They often search across Facebook, recommendations, search engines, and individual business pages.

Problems:

- Difficulty finding trusted pet services and comparing available options.
- Service details, prices, locations, and availability are not always clearly displayed.
- Finding someone to care for a pet while away can be difficult.
- Pet-related information, products, community discussions, and lost-pet posts are spread across separate sources.

Requirements:

- A structured Service Directory containing service categories, business details, locations, opening information, and contact options.
- A community space for asking questions, sharing experiences, and accessing pet-care discussions.
- Clear Marketplace listings containing prices or “contact for price,” condition, availability, location, description, and seller contact details.
- A Lost & Found area where users can report missing or found pets and contact other users directly.

C. Local Pet Businesses and Service Providers

This group includes local pet businesses and service providers that use public Facebook pages to present services or products and communicate with customers. The typology is based on the structured observation of 10 selected pages rather than interviews with business owners.

Observed Gaps:

- Prices, services, products, locations, and opening information are presented inconsistently.
- Important details may be spread across posts rather than organised in one place.
- Posting activity and response behaviour differ between businesses.
- Trust information, such as addresses, maps, reviews, business hours, customer photographs, and staff credentials, is not displayed consistently.

Requirements:

- Structured business profiles containing service categories, business information, location, opening information, and contact options.
- A clear way to present services or products using consistent listing fields.
- Fields for displaying available trust information, such as addresses, opening hours, reviews, customer photographs, and staff credentials.
- Direct contact options that allow customers to make enquiries about prices, availability, services, or products.

These typologies guide the design of Petio's Community, Service Directory, Marketplace, and Lost & Found features. They also provide the foundation for the user personas and journey maps presented in the following section.

2.3 User Personas and Journey Maps

To examine how different users may interact with Petio, three fictional personas were developed from the user typologies presented in the previous section. The first two represent prospective and current pet owners, while the third represents local pet businesses and service providers. These personas are not individual research participants. They combine the common needs and behaviours identified through the survey and business-page observation.

Persona 1 – Prospective Pet Owner

Figure 2.1. Prospective Pet Owner Persona.

This persona represents someone who is planning to get a pet and wants to understand the responsibilities before deciding. Their main goal is to learn about everyday care, healthcare needs, expected costs, suitable products, and available services. They usually search social media, search engines, recommendations, and individual business pages for guidance.

Their journey begins by researching pet ownership and comparing information from different sources. When advice or service details are unclear, they may ask other pet owners or contact businesses directly. Petio supports this journey through beginner-friendly Community discussions, structured service information, and Marketplace listings.

Persona 2 – Current Pet Owner

Figure 2.2 Current Pet Owner Persona.

This persona represents someone who currently owns a pet and needs support with healthcare, temporary care, products, services, and unexpected situations. Their main goal is to find suitable information and options without moving between several disconnected platforms.

Their journey usually begins when a pet-related need appears. They search Facebook, ask friends or family, use search engines, and review individual business pages before contacting possible providers or sellers. Petio brings these activities together through its Community, Service Directory, Marketplace, and Lost & Found features. Structured information and direct contact options help users compare available choices more clearly.

Persona 3 – Local Pet Business Representative

Figure 2.3. Local Pet Business Representative.

This persona represents a local pet business or service provider that uses a public Facebook page to present services or products and communicate with customers. Their main goal is to display important business information clearly and respond to customer enquiries. This persona is based on patterns observed across the 10 selected Facebook pages rather than interviews with business owners.

Their current journey involves publishing posts, maintaining page information, and responding to questions through Messenger, phone calls, or Telegram. Details about prices, availability, locations, opening hours, services, or products may be divided across several posts and conversations. Petio supports this journey through structured business profiles, consistent listing fields, visible trust information, and direct contact options.

Together, these personas provide the foundation for the design criteria presented in the next section.

2.4 Design Criteria

The research findings, user typologies, and personas were used to establish the design criteria for Petio. These criteria guide the organization, content, and interaction of the mobile-interface prototype without repeating the individual research findings.

A. Clear and Simple Navigation

Users should be able to move between the Community, Service Directory, Marketplace, and Lost & Found features without confusion. Navigation labels, buttons, categories, and page structures should remain consistent across the interface. Important actions, such as creating a post, browsing a service, listing an item, or reporting a missing or found pet, should be easy to identify.

B. Structured and Consistent Information

Business profiles and listings should use consistent fields so users can review and compare information more easily. Service Directory profiles should present service categories, business details, locations, opening hours, and contact options. Marketplace listings should include category, price or “contact for price,” condition, availability, location, description, and seller contact details.

C. Trust and Transparency

Petio should display available trust information clearly without claiming that every provider, seller, or detail has been independently verified. Business profiles may show information such as addresses, maps, opening hours, reviews, customer photographs, and staff credentials when available. Reporting options should also be visible so users can flag inappropriate posts, listings, or accounts.

D. Direct Communication

Users should be able to contact businesses, service providers, sellers, and other users when they require more information. Clear contact actions should support enquiries about prices, availability, locations, services, products, or lost-and-found reports. Petio supports communication and listing discovery but does not include booking, checkout, online payment, or delivery functions.

E. Accessible Mobile Interaction

The interface should use readable typography, clear contrast, familiar icons, simple language, and touch-friendly controls. Content should be divided into manageable sections so users can scan information without facing overcrowded screens. Consistent spacing and visual hierarchy should help users understand which information and actions are most important.

F. Community Participation

The Community should allow users to ask questions, share experiences, reply to posts, and identify useful contributions. Categories and search tools should help users locate relevant discussions. Reporting controls and clear user information should support safer participation without suggesting that all community content has been formally verified.

Together, these criteria provide a practical foundation for Petio's interface design and guide the development of its main features in the interactive Figma prototype.

CHAPTER 3: DESIGN PROPOSAL

3.1 Design Statement

Petio is a mobile application prototype designed to help pet owners find pet-care information, local services, products, and community support in one place. The research showed that people currently search through Facebook, friends and family, Google, and separate business pages. This makes useful information harder to find and compare.

Petio organises this information through four main features: Community, Service Directory, Marketplace, and Lost & Found. The interface uses simple navigation, clear categories, structured information, and direct contact options to help users find what they need.

The overall design is friendly, clean, and easy to use on a mobile device. It is designed for both pet owners and local pet businesses without including booking, online payment, checkout, or delivery.

3.2 Mood Board

Petio mood board was created to define the visual style of the mobile application prototype. It brings together colour, typography, imagery, and interface references that communicate a friendly, warm, and trustworthy feeling.

Figure 3.1. Petio Mood Board

These visual choices create a warm and approachable identity while keeping the mobile interface clean and easy to understand.

3.3 Design Direction and Core Features

Petio will be designed for mobile devices, with simple navigation, clear categories, readable text, and controls that are easy to tap. The same colours, typography, card styles, and icons will be used across the prototype to keep the experience consistent. Information will be divided into clear sections so users can find important details and actions without facing crowded screens.

A. Community

The Community will allow users to ask questions, share experiences, reply to posts, and mark useful contributions as helpful. Categories and search tools will help users find relevant discussions, while reporting options will support safer participation.

B. Service Directory

The Service Directory will help users browse local pet businesses and service providers by category. Business profiles will present service information, location, opening hours, contact options, and available trust details in a consistent format. Users will contact providers directly when they need more information.

C. Marketplace

The Marketplace will allow users to browse, save, create, and manage pet-related listings. Each listing will present the category, price or “contact for price” condition, availability, location, description, photographs, and seller contact details. It will support direct enquiries but will not include checkout, online payment, or delivery.

D. Lost & Found

The Lost & Found feature will allow users to report missing or found pets using photographs, locations, dates, descriptions, and contact details. Users will be able to browse or search reports and contact the person who created a post when they have useful information.

Together, these features will provide a clear and connected experience for prospective pet owners, current pet owners, and local pet businesses.

3.4 Business Model Canvas

Petio’s Business Model Canvas presents a proposed business model for a future working application in Phnom Penh. The current project deliverable is an interactive Figma prototype. It does

not have live payments, business verification or administrative systems yet. The canvas therefore describes how Petio could operate after development and launch.

Figure 3.2. Petio Business Model Canvas

Petio would keep its main features accessible for free and earn income from optional promotion. Pet owners could use the Community, Service Directory, Marketplace and Lost & Found without paying. Local businesses and approved sellers could pay when they want their profiles or listings to receive additional visibility.

A. Revenue streams

• Featured Business Plan

- Pricing: An approved pet business or professional service provider could pay \$4.99 per month.
- Benefits: Its profile would receive featured placement in relevant Service Directory results. The plan would also include up to two optional seven-day Marketplace listing boosts during each paid month. Unused boosts would not carry over.

- Target customers: Veterinary clinics, groomers, pet shops, pet-care providers and other relevant local services with owner-claimed profiles.
- Trust distinction: Payment would provide visibility only. A business check would require Petio to review the owner's claim and supporting details. Buying the plan would not automatically grant a check.

Petio would still provide basic business profiles for free. This would allow people to find and contact local providers while giving businesses a reason to consider the paid option once Petio has an audience.

B. Additional Revenue Stream

• Marketplace Listing Boost

- Pricing: An approved seller could pay \$1.99 to promote one listing for seven days.
- Benefits: The listing would receive temporary additional visibility. Ordinary listings would remain free.
- Trial: Petio could offer one free seven-day boost to each approved account so sellers can try the feature before paying.
- Target customers: Individual sellers and businesses listing pet-related products.

Community participation and standard Lost & Found reports would remain free in Year 1. Petio would not charge a commission on products or services because users would contact sellers and providers directly. The proposed model does not include ordering, checkout or payment for those transactions.

C. Marketing Strategy

Petio's first launch area would be Phnom Penh. The team would introduce the application through short, friendly pet-related videos on TikTok and Facebook, usually around 40–50 seconds long. It would also reach people through existing pet communities and direct local outreach. Paid posts could support content that performs well, within a \$300 Year 1 advertising budget.

The Year 1 goals are 5,000 registered user accounts and 100 owner-claimed pet-business or professional service profiles. A claimed profile would count only after its owner submits the required information and Petio reviews the request. These figures are targets, not users or businesses already acquired.

D. Cost and Revenue Projection

The two founders plan to contribute \$500 each, providing \$1,000 in starting funds. This money is funding, not sales revenue. They would develop and manage the initial application themselves without drawing salaries in Year 1.

- Server: A proposed basic 2 GiB server at \$12 per month, or \$144 for the year.
- Weekly backups: Estimated at \$2.40 per month, or \$28.80 for the year.
- Photo storage: Estimated at \$5 per month, or \$60 for the year.
- Domain: An indicative first-year price of \$11.08, taken from the team's price screenshot. The checkout and renewal prices would need checking.
- Google Play developer registration: A proposed \$25 one-time fee for an Android release.
- Paid promotion: Up to \$300 for the year.

If the full advertising budget is spent, these priced items total \$568.88. That leaves \$431.12 of the founders' funds unallocated as a reserve. Business registration, taxes, payment charges, moderation tools, notifications, security work and extra hosting capacity have not yet been priced. The proposed server is a starting estimate. Petio would need to test real usage before claiming it can reliably support 5,000 users.

The Year 1 income scenario assumes no paying businesses in Months 1–3, two paying businesses per month in Months 4–6, five in Months 7–9, and 10 in Months 10–12. This equals 51 paid business-months, producing \$254.49 at \$4.99 each. A further 30 separately paid listing boosts at \$1.99 would produce \$59.70. Boosts included in the business plan and free trials are excluded from those 30 sales.

Under these assumptions, Year 1 gross revenue would be \$314.19. Compared with \$568.88 in priced spending, this leaves a \$254.69 shortfall before other charges. Petio therefore does not assume it will break even in its first year.

E. Growth Timeline Projection

Year 1 (Months 1–12): Launch and Audience Building

- Months 1–3: Prepare a working application, begin local outreach and publish introductory content. The revenue scenario assumes no paid business plans during this period.
- Months 4–6: Begin reviewing business claims and testing the paid promotion offers. The scenario assumes two paying businesses per month.
- Months 7–9: Improve profiles, listings and outreach using early feedback. The scenario increases to five paying businesses per month.

- Months 10–12: Review user activity, business renewals and operating costs. The scenario assumes 10 paying businesses per month. Petio’s end-of-year goals are 5,000 registered users and 100 claimed business profiles.

Year 2 (Months 13–24): Retention and Measured Growth

- Months 13–15: Review Year 1 results and improve the business claim process, listing quality and hosting setup where needed.
- Months 16–18: Continue sharing short pet-related videos and reaching local pet communities. Track how many businesses pay for another month of the Featured Business Plan and how many sellers buy a separate Marketplace Listing Boost.
- Months 19–21: Improve the Service Directory and Marketplace based on searches, enquiries and seller feedback. Add administrative tools if manual review becomes difficult to manage.
- Months 22–24: Assess whether Petio is ready to expand its reach or paid offers. The provisional end-of-year goals are 7,500 registered users and 150 claimed business profiles.

A cautious Year 2 revenue scenario assumes that 10 businesses continue paying each month and 60 separate listing boosts sell across the year. This would produce \$598.80 from business plans and \$119.40 from boosts, or \$718.20 in gross revenue. Year 2 operating costs have not been established, so this figure is not a profit estimate.

F. Research and Projection Limits

The survey indicates interest in pet services, and the observation of 10 business pages shows how selected providers currently present information. Neither establishes what businesses would pay for Petio. A questionnaire was sent to 11 business pages, but no replies had been received at the time of writing.

The Year 1 and Year 2 customer and revenue figures are therefore planning scenarios, not outcomes demonstrated by the research. Before treating them as forecasts, Petio would need to measure active users, business willingness to pay, renewals, listing-boost sales and actual running costs.

3.5 Design Development & Interface Evolution

Petio’s interface was refined as the research findings and design criteria were applied to the Figma prototype. The main aim was to make the four features easy to find and to keep information clear on a mobile screen. This section compares earlier and later designs to show what changed and

why. The comparisons describe design decisions made during the project, they do not claim that formal usability testing was conducted.

A. Home Screen

The earlier home screen displayed Petio's four main features as large cards in a single column. This gave each feature room for its icon and description, but users had to scroll farther to see the Lost & Found section and the content below it.

In the final design, the same four features are arranged in a two-column grid. Users can see Community, Service Directory, Marketplace, and Lost & Found together near the top of the screen. The shorter layout also brings the urgent lost-pet report and nearby services closer to the first view. The greeting, feature labels, and bottom navigation remain consistent between the two versions.

Figure 3.3. Earlier Petio home screen

Figure 3.4. Final Petio home screen

B. User profile

The earlier profile placed the photograph above the user's name and details. This made the profile card tall, leaving less room on the screen for the Trust & Status and My Activity sections.

In the final design, the photograph sits beside the name, location, and Edit Profile button. The profile counts remain below them, while the shorter card allows users to see more of their activity without scrolling. The Helpful Member status and Request Verification option remain in the same section. This change makes better use of the mobile screen while keeping the profile information easy to read.

Figure 3.5. Previous Petio user profile screen

Figure 3.6. Final Petio user profile screen

C. Public profile

The previous public profile showed the member's details, activity counts, and About section, but it did not offer a clear action for contacting or sharing the profile. In the final design, Message and Share profile buttons were added below the member details. A separate Badge section also displays the member's Helpful Member and Lost Pet Helper badges.

These additions make the profile more useful to someone viewing another member's account. The existing details and activity counts remain visible, so users can review the profile before choosing an action.

Figure 3.7. Previous Petio public member profile

Figure 3.8. Final Petio public member profile

CHAPTER 4: FINAL DESIGN

This chapter presents Petio's final visual design and interactive Figma prototype. It shows how the project's concept and brand identity appear across the mobile interface, then introduces the main screens for Community, Service Directory, Marketplace, and Lost & Found. The prototype demonstrates the intended user experience, and it does not represent a launched application.

4.1 Concept

Petio's concept is presented through two posters. The first introduces the user journey: exploring pet-related content, choosing relevant services or products, connecting with others, and contributing to the community. The second presents Petio's four core features—Community, Service Directory, Marketplace, and Lost & Found—alongside a mobile screen mockup. Together, the posters show how Petio's friendly visual style supports its purpose of bringing pet-related needs into one place.

Figure 4.1. Petio Poster 1

Figure 4.2. Petio Poster 2

4.2 Brand Identity

Petio's brand identity combines a pet illustration with rounded typography and a warm colour palette. The logo appears in two versions: a full wordmark and a compact symbol for smaller spaces. Forest Sage is used for prominent headings and actions, while Warm Cream provides the main background. Apricot, Soft Coral, and Powder Blue add colour to feature areas and illustrations, Cocoa supports readable text. Fredoka is used for headings, with the body font used for shorter descriptions and interface labels. These elements are applied consistently across the final mobile screens.

4.3 Platform

Petio's final prototype organises its four core features around common pet-related needs. The home screen provides entry points to Community, Service Directory, Marketplace, and Lost & Found,

with selected lost-pet reports and nearby services visible below them. The following screens show how each feature is presented in the mobile interface.

A. Home page

The home page gives users a starting point for Petio's four main features: Community, Service Directory, Marketplace, and Lost & Found. Each feature has a separate card with a short description, making the available paths easy to scan. Below the cards, the page highlights an urgent lost-pet report and previews a nearby service. The navigation bar provides another way to move between the main areas of the prototype.

Figure 4.3. Petio Home Page

B. Account Access

The account access screens introduce Petio's visual style before users reach the home page. The Create Account screen asks for a full name, email address, password, and agreement to the Terms and Privacy Policy. People who already have an account can use the Sign In screen, which includes a link to Forgot Password. The password-reset screen shows where a user would enter their email to request a reset link. These screens illustrate the intended account flow in the Figma prototype.

The image shows a mobile app screen for creating an account. At the top, there is a back arrow and the Petio logo, which features a cat and a dog. Below the logo is a large illustration of a cat and a dog sitting together with a heart and some confetti. The title "Create your account" is centered, followed by the subtitle "Join Petio and connect with Cambodia's pet community." The form consists of four input fields: "Full name" with placeholder text "Enter your full name", "Email address" with placeholder text "Enter your email", "Password" with placeholder text "Create a password" and a toggle icon, and "Confirm password" with placeholder text "Enter password again" and a toggle icon. Below the fields is a checkbox labeled "I agree to Petio's Terms and Privacy Policy." At the bottom is a large green button labeled "Create account" and a link "Already have an account? Sign in".

Figure 4.5. Sign In Screen

Figure 4.6. Forgot Password Screen

C. Pet Readiness

The Pet Readiness flow gives prospective owners a way to think through the responsibilities of caring for a pet. The first screen presents five questions, beginning with whether the user can provide daily time for feeding, exercise, and care. Each question includes a short explanation of why the topic matters. The results screen then displays an example readiness score and summarises areas such as time, expenses, living space, household support, and long-term responsibility. It also provides a path to explore Adopt & Foster.

The image shows a mobile app screen titled "Pet Readiness". At the top left is a back arrow icon. Below it is a clipboard icon with a checklist and a paw print. The main heading is "Are you ready for a pet?" followed by the instruction "Answer five quick questions to see what you may need to prepare." Below this is a progress indicator showing "Question 1 of 5" with a green bar. The question is "Can you provide daily time for feeding, exercise, and care?". There are three radio button options: "Yes" (selected), "Not Sure", and "No". Below the options is a section titled "Why it matters" with a lightbulb icon and the text "Pets need consistent daily care, even on busy days." At the bottom is a green button labeled "Next question".

Pet Readiness

Are you ready for a pet?

Answer five quick questions to see what you may need to prepare.

Question 1 of 5

Can you provide daily time for feeding, exercise, and care?

☒ Yes

☐ Not Sure

☐ No

Why it matters

Pets need consistent daily care, even on busy days.

Next question

Figure 4.7. Pet Readiness Question Screen

Figure 4.8. Pet Readiness Results Screen

D. Community

The Community screen brings pet-related discussions into a searchable feed. Topic categories help users find relevant posts, while the post cards show the author, topic, content, and options to view replies or mark a contribution as helpful. The prototype also includes screens for opening a discussion and creating a post, allowing users to follow the journey from browsing to sharing a question or experience.

Figure 4.9: Community Feed Screen

Figure 4.10: Community Post Details and Create Post Screens

E. Service Directory

The Service Directory presents pet businesses and service providers in a consistent format so users can browse and compare options. Service cards show key details, while a full profile provides the business description, services offered, location, opening hours, and contact actions. The prototype shows options to call a provider, or open directions in a map. Any verification label shown on a sample profile represents the proposed interface, it does not establish that the displayed business has been independently checked.

Figure 4.11: Service Directory Screen

Figure 4.12: Service Details Screen

F. Adopt and Foster

The Adopt & Foster area gives users a place to explore pets presented for adoption or temporary care. It follows naturally from the Pet Readiness result screen, which offers a link to this area. The design presents pet information in a structured format so users can review an opportunity and contact the person or organisation responsible for it. Petio does not process an adoption within the prototype.

Figure 4.13: Adopt & Foster Browse Screen

Figure 4.14: Adopt & Foster Pet Details Screen

G. Marketplace

The Marketplace screen displays pet-related items in a browsable listing layout. Users can open a listing to review its photographs, price or “contact for price”, condition, location, description, and seller information. The prototype also shows how someone would prepare a listing and make a direct enquiry to a seller. Purchases, online payment, and delivery are outside this flow.

Figure 4.15: Marketplace Browse Screen

Figure 4.16: Marketplace Listing Details Screen

H. Lost and Found

The Lost & Found screens present missing and found pet reports with photographs, locations, descriptions, and contact options. Users can browse reports, open one for more information, or prepare a report of their own. The home page also shows an example report marked “Urgent” to demonstrate how a time-sensitive case can be made more visible in the interface.

I. Profiles and Trust

Petio's profile screens show how members present their information and activity to others. The personal profile includes activity counts, a Helpful Member status, and a Request Verification option. A public profile shows member information, Message and Share Profile actions, and badges such as Helpful Member and Lost Pet Helper. These are interface examples in the Figma prototype, the displayed badges and verification status do not represent independently checked real accounts.

Figure 4.19: Personal Profile Screen

Figure 4.20: Public Member Profile Screen

J. Explore

The Explore screen provides another way to find Petio's content. It places a search field at the top, followed by a Pet Readiness card with a link to start the check. Below it, four cards lead to Service Directory, Marketplace, Lost & Found, and Adopt & Foster. This layout lets users choose an area based on what they need without returning to the home page.

Figure 4.21. Petio Explore Screen

4.4 Clickable Prototype

Petio's final screens were connected in Figma to demonstrate how users would move through the mobile interface. The prototype starts with account access and leads to the Home and Explore screens, where users can open the Community, Service Directory, Marketplace, Lost & Found, Pet Readiness, and Adopt & Foster sections. It also demonstrates actions such as opening a service profile and selecting directions.

The prototype shows the intended navigation and screen design. It is a design demonstration rather than a launched application, so the screens do not establish that services such as account creation, messaging, or payment are operational.

Figure 4.22. QR Code Linking to the Petio Clickable Prototype

CHAPTER 5: CONCLUSION & FUTURE WORK

5.1 Summary

Petio is a mobile application prototype designed to bring pet-related information, local services, products, and community support into one place. The project began with a survey of current and prospective pet owners and an observation of local pet-business Facebook pages. These findings helped identify difficulties in finding clear service information and comparing options across separate sources.

The research informed Petio's user typologies and design direction. The team then developed a visual identity and designed the Community, Service Directory, Marketplace, and Lost & Found features, alongside supporting screens such as Pet Readiness and Adopt & Foster. The outcome is a high-fidelity Figma prototype that demonstrates the proposed interface and navigation. It provides a design foundation for future development, rather than a launched application.

The prototype brings the proposed features together in one visual system and shows how a user could move between them. However, the project did not produce a working application or conduct formal usability testing with external users. Its effectiveness therefore still needs to be tested before development decisions are finalised.

5.2 Lessons Learned

The Petio project showed us the importance of using research to guide design decisions. The pet-owner survey and business-page observation helped us identify problems with scattered information and inconsistent service details. We also learnt to distinguish between what the research showed and what we were proposing as a future solution.

Designing the prototype taught us how to organise several features within one mobile interface. We refined the navigation, screen layouts, and visual details to make Petio easier to explore while keeping its style consistent. The process also showed us the need to keep the document aligned with the final Figma screens and to describe the prototype accurately as a design, rather than a working application.

The research also showed us the limits of our evidence. The survey involved a small group, while the business research recorded what was publicly visible on 10 Facebook pages. We learnt to use these findings to guide the design without treating them as proof that all pet owners or businesses have the same needs.

5.3 Future Development Plans

The next step for Petio is to turn the Figma prototype into a working mobile application. Development would begin with account access, the four core features, and the ability to create posts, listings, and lost or found pet reports. Before launch, the team would need to test the main user journeys, protect user information, and check that the application can handle its expected number of users.

After launch, Petio could improve the service and seller profiles using feedback from pet owners and local businesses. The team would also need to define how business details and account badges are checked before presenting them as verified. Pet Readiness and Adopt & Foster could be refined as supporting features.

Future paid options, such as featured business profiles or promoted listings, should depend on evidence that businesses want to pay and that Petio can cover its running costs. Lost & Found reports would remain free in the first year. Any later paid visibility option would need to preserve a useful free way to report a missing pet.

Once the core functions work, the team should test tasks such as finding a service, contacting a seller, creating a community post, and reporting a missing pet with potential users. Their feedback should guide changes to navigation, forms, and the information shown on each screen.

CHAPTER 6: APPENDIX & REFERENCES

6.1 Initial Research Findings

This section presents the materials used in Petio's initial research. The pet-owner survey received 41 submissions, although the number of answers varied by question. The survey form is shown below to document what participants were asked. The survey results and the observation of 10 public pet-business Facebook pages are discussed in Chapter 2.

1. Do you currently own a pet?

☐ Yes.

☐ No, but planning to.

☐ No.

2. What type of pet do you own? (Select all that apply)

☐ 🐶 Dog

☐ 🐱 Cat

☐ 🐦 Bird

☐ 🐟 Fish

☐ 🐰 Rabbit

☐ 🦎 Reptile (Lizard, Turtle, Snake)

☐ 🐹 Small Mammal (Hamster, Guinea Pig)

☐ Other: _____

3. How long have you been a pet owner?

☐ Not yet but planning to have one.

☐ Less than 1 year

☐ 1–3 years

☐ 4–6 years

☐ More than 6 years

4. What do you think about having a loving pet in your life?

Your answer _____

5. What do you think is the biggest challenge that pet owners face?
(Select up to 3)

- ☐ Finding reliable information
- ☒ Buying pet supplies
- ☐ Finding pet services
- ☐ Pet healthcare
- ☐ Finding someone to care for my pet
- ☐ Other: _____

6. Where do you usually look for pet-related information?(Select up to 3)

- ☐ Facebook
- ☐ Google
- ☐ Friends & Family
- ☐ Veterinarians
- ☐ YouTube
- ☐ Other: _____

7. Have you ever struggled to find trusted pet services (pet hotel, grooming, pet sitter, etc.)?

- ☐ Yes.
- ☐ No.

8. Have you ever needed someone to take care of your pet while you were away?

- ☐ Yes.
- ☐ No.

9. Would you use a platform that brings pet owners, pet services, and pet products together in one place?

- ☐ Definitely.
- ☐ Maybe.
- ☐ No.

10. Which feature would you use the most? (Select up to 3)

- ☐ Community & Chat
- ☐ Pet Marketplace
- ☐ Pet Services
- ☐ Lost & Found Pets
- ☐ Pet Care Articles (Learn more about your pet)

11. How important is a trusted community where pet owners can ask questions and share experiences?

- ☐ Very Important.
- ☐ Important.
- ☐ Neutral.
- ☐ Not Important.

12. Would you feel safer using **verified** sellers and service providers?

- ☐ Yes.
- ☐ Maybe.
- ☐ No.

13. Which pet service would you use most often? (Select up to 2)

- ☐ Pet Hotel
- ☐ Pet Sitting
- ☐ Grooming
- ☐ Adoption/Fostering
- ☐ Veterinary Services (Vet)

14. What feature would make Petio most valuable to you, and what feature would you add?

Your answer _____

Final Question.

We're almost done! Share any final thoughts or suggestions to help us improve Petio.

15. If Petio were available and free today, would you recommend it to your friends or family who own pets?

☐ Definitely.

☐ Maybe.

☐ No.

6.2 Internal Design Review

The team compared earlier and final versions of selected Figma screens. On the Home page, the four main feature cards were rearranged into two columns to make them easier to scan. The My Profile page was made more compact and now shows activity counts more clearly. On the Public Profile page, Message and Share Profile actions and visible badges were added. The earlier and final screens are shown in Section 3.5.

These changes came from the team's internal design review. Petio has not yet undergone formal usability testing with external users.
